Assignment-13

Nischitha, W
321910304054

1) what is dictionary in python? Explain with examples.

→ A dictionary is a collection which is unordered, changeable and indexed. In Python dictionaries are written with curly brackets and they have keys and values.

Eg → Dict = dict()

dict() method helps to create a dictionary.
dict = {1: "Nischitha", 2: "VN"}

Here 1, 2 are key with their respective values.

2) What are tuple? Explain with example.

→ A tuple is a collection which is ordered and unchangeable. In Python tuple are written with round brackets.

Ex → Tuple = ("apple", 1, 1, 4, 3)

Tuple contains values on its indexes (0 - x - 1), they are similar to list.
